

AI Support Agent — resolve more tickets, safely

An AI agent that answers customer support questions end to end — and knows when to hand off to a human.

The problem

Support volume keeps rising, but answers don't keep up. Front-line agents juggle three separate systems for a single question — the customer's **account**, the **product documentation**, and **what their plan actually includes** — and the answer often lives in the gap between them. The result: slow first responses, inconsistent answers, and skilled people spending their day on routine lookups.

What it does

A single agent handles the conversation end to end. For each question it decides which sources it needs, pulls them together, and either resolves the question or escalates with context — from one-off questions (“how do I enable SSO?”) to questions that need several systems at once (“does *my* plan include priority support?”).

Why you can trust it

- **Read-only by design.** It can look up account and billing information, but cannot make changes — no cancellations, refunds, or plan edits. Those always go to a human.
- **It refuses risky requests and escalates.** Asked to do something it shouldn't, it does the safe part, declines the rest, and routes it to the right team — in one reply.
- **It never makes things up.** When the information isn't available, it says so and escalates, rather than guessing.
- **It remembers the conversation** — customers don't repeat themselves — within bounds.

What you can measure

Every interaction is fully logged: which sources were used, what they returned, where it escalated, and the **tokens, cost, and response time** of each one. You can see exactly what the agent did on any ticket, and price it. Reliability is verified against a fixed suite of real scenarios — routing, multi-step questions, and every failure mode — all passing.

The bottom line

Faster, consistent first responses on routine questions; humans freed for the cases that need them; and a full, costed audit trail behind every answer. The agent extends a team's capacity without giving up control or visibility.

Demonstrated on a working prototype. The account and billing connections use stand-in data; the agent is built so that swapping those for live systems does not change how it behaves. Technical write-up and source available on request.
